

To make Bio fuel from waste Project

We can make bio fuel from wastes and run vehicles with it. Hotels and restaurants produces a large number of waste daily which to waste otherwise. This waste should be collected regularly and sent to the Fuel Factories where oil can be exerted from this garbage and converted into bio fuels. This garbage contains a high intake of oils which can be easily converted into the bio fuels in plants to produce energy to run the diesel which runs vehicles. This is a green technology and also efficient system of garbage disposal in a regular and systematic way. Thus we can produce and save a lot of fuel and ease the energy crisis. This is a cheap method of producing bio-fuel in cities and a alternate source of energy which is also a efficient method of garbage disposal system. GPS technology can be used for the collection and transportation of garbage and wastes from hotels to make this system successful. The hotels garbage bins and the trucks are to be connected with the GPS system to locate the garbage and can be transported regularly to the destination to produce bio fuel. The GPS system can track the garbage production in hotels. All hotels and restaurants should be approached in cities to make this technology successful.
